

My name is Erick, I have been with SoCal industries safety department for 10 years. From a safety professionals' point of view One of the first issues I had to change was a caustic chemical used to clean portable units. Just to give an example how caustic and serious the old product was, it ate through the top layer surface of pavement downward flow into wastewater drain, imagine what this would do if it got onto body, eyes or even swallowed.

After trying this and that nothing came close to the cleaning power of Bio Tuff without the high volume of hazardous/caustic ingredients, don't get me wrong, if this got into eyes it will burn or sting but won't cause permanent eye damage like other caustic chemicals. SoCal Industries has been using Bio tuff for 7 years now, Bio Tuff not only works for our industry it is also safer than those other caustic cleaning solutions. Our staff is content with Bio tuff since it's safer to use. It is used both in facility and field. As a company I understand that the bottom line is efficiency. The safety of persons using product daily saves money on the back end from chemical injuries and WC claims; money saved is money earned.

After introducing Bio tuff degreaser we have eliminated all other caustic cleaning agents, we here at SoCal prefer the safer solution than the dangerous caustic cleaning products just because of how much we use the product.
